一、背景

這次 Project 使用 VerilogHDL 撰寫，以 Midterm Project 所設計之 ALU Design 為基礎， 參考課本 Chapter 4 與課程講義之 Pipelined Datapath，設計一個 Pipelined MIPS-Lite CPU。透過本次的分組作業讓我們能夠熟悉 VerilogHDL 的語法並能夠靈活運用。

二、方法

(1)設計重點說明:

利用老師的 Single Cycle CPU 加入 4 個 Pipeline Register 來實現本次 Final Project 的 PipelineCPU 並且實現下列 16 道 MIPS 指令

a) Integer Arithmetic: **add, sub, and, or, srl, slt, ori**

b) Integer Memory Access: **lw, sw**

c) Integer Branch: **beq, j, jr**

d) Integer Multiply/Divide: **divu**

e) Other Instructions: **mfhi, mflo, nop**

(2)Datapath 與詳細架構圖:

請見下一頁(較於詳細，易看)

四、討論

1.寫 Pipeline 時，要確認每一道時序想像中與實際的差距，需要確認哪一到指令先做與否。

五、結論

這次的 Final Project 我們都覺得非常困難，一開始瞭解 pipeline 的原理和架構就覺得有點沒頭緒，概念性的東西似懂非懂，好像理解了，但實做的過程中又想不到要怎麼寫，實做過程基本上部分東西是拿期中 Project 的東西來改，幫我們的 CPU 加了一些功能，然後這次的東西其實老師已經幫我們寫好大部分的元件了，所以要作 Pipeline 必須要涉及到很多需要接線的狀況，不小心就會因為手殘造成的問題也是頻頻發生，debug 方面的感覺也跟期中不一樣，期中基本上就看出來的值是不是對的就可以找到問題，這次要對著 wave 一個個對比，確認訊號是否正確，再加上可能上課沒那麼認真聽講和信息傳達等一系列原因，以為 Hazard 是要解決的，實際上不用因為老師其實也沒講到。。。通過寫不用寫的 hazard，我們從錯誤中學到可以手動添加 NOP 來處理 hazard，總體來說還是收穫蠻大的，這次的 Final Project 的 PipelineCPU 是我們本學期計算機組織課程的集大成，也是最精采最精華的部分。

六、未來展望

我覺得經過這次的期末 project，我們對 Verilog 的使用終於走出了新手村，更加得心應手了，但因為這次可能進度有點趕的原因，沒有要求我們實做處理 hazard 的部分，雖然理論上知道該怎麼做，也確實陰差陽錯的實際寫了這塊的東西，但很遺憾寫出來的東西並不太行，我覺得只後有時間可以自己試著把這塊內容好好寫一遍，應該會有更多的收穫。
